Is there a role for the branched chain amino acid L-leucine in the treatment of neuropathic pain? L-leucine administration is known to modify levels of brain glutamate. Since levels of glutamate are elevated in chronic pain syndromes, L-leucine may be of benefit in these conditions. This pilot study investigated the effect of L-leucine supplementation on chronic neuropathic pain in 15 patients. L-leucine was administered intravenously in a dose of 500 mg for three days with a pre- and post-test design. Patients received either the placebo or the L-leucine treatment before the pre-test and then they were crossed over to the other treatment in a blinded fashion. Patients recorded pain levels twice a day and rated them on a Likert-like scale. The endpoint was the greatest improvement in pain over the three days. Patients receiving L-leucine reported significant improvement in pain, both before and after treatment. Their pain improved significantly more than the placebo group. Although pain levels were initially comparable between the two groups, L-leucine seemed to improve pain more rapidly in the treated patients. This f3e1b3768c
