But what if you can't afford Photoshop? Never fear! You can use the following programs instead. Tutorials Even though Photoshop is a powerful tool, editing photographs can be as simple as creating a new layer and choosing an adjustment layer (as described in the upcoming sections). Creating simple web graphics is as easy as cutting the right shape out of

a picture and pasting it into a background graphic. You can create a new layer with any picture editor. Any windows image viewer can display layers, so it doesn't matter what program you use. Although Photoshop is the most common choice, you can use a variety of different programs. Not all image editors have layers, so if you're not sure what you're doing, a program that isn't intended for creating layers might not work right. • Mosaic: Mosaic is a free image editing program that you can download from the Internet (www.luminis.com). The program makes it easy to cut out and reassemble images.

Select the layer you want to cut out of the image, press Ctrl+C (⌘-C), then press Ctrl+V (⌘-V) to paste the image. The image will be placed in the background of the layer, and you can add layers to the image to create your own mosaic design. Mosaic comes with a variety of different background options that you can choose from. • GIMP: GIMP is a popular free image editing program that you can find at www.gimp.org. Its features are similar to those in Photoshop and Macromedia Dreamweaver, as well as those in programs such as Adobe Illustrator. GIMP includes many tools that are similar to those in

Photoshop, and you can use the program to cut out images and edit them for your web designs. • Photoshop Elements: Photoshop Elements is a free downloadable image editing tool that you can find at www.adobe.com/products/photoshopel/index.html. A portable version is available as well. If you are looking for a small and simple image editing program that doesn't cost any money, Photoshop Elements is a great choice. It's available in both CD and DVD formats. • Any image editor: You can use any image editor to create new layers, do image editing, and create web graphics. Just remember that most editors aren't as powerful

as Photoshop or Photoshop Elements, and you may be limited in what you can

Photoshop Elements Tutorial: How to Make a White Logo in Photoshop Elements Adobe Photoshop Elements Tutorial: How to Add a Red Watermark to an Image 1. What is a GIF? GIF stands for Graphics Interchange Format and it is an image format created by CompuServe in 1987. Today, GIF is the most common format for sending web graphics. If you upload a GIF to Facebook or Twitter, you will see that the file has a.gif at the end of its name. The GIF file will be optimized by the tool and compressed using different methods. The final result is a single file optimized for web use. It is not a video or a video

clip. It is used to display images over time in the browser. So why use a GIF file, when you can use the superior image editor, Photoshop? To create a GIF file, you need a specific GIF editor. Photoshop has no special feature that allows you to create a GIF file. You can only do that manually. GIF files are very small. Since you can save a single file for each image, the file sizes are extremely small. So in this case, it is easier to create a GIF file using Photoshop Elements. This is one of the uses of Photoshop. Q: PathPlot3D [Plot3D] How do I use Plot3D with a List of points? I've tried the following but received a scoping error. Plot3D[Flatten[Table[{{i, j, k}, {i, j, k}}, {i, 5, 10}, {j, 5, 10}, {k, 5, 10}], 1], {i, 1, 5}, {j, 1, 5}, {k, 1, 5}] A: To have Plot3D display points directly, do the following: ListPointPlot3D[{a, b, c}, PlotPoints -> 4] Also, for your specific question, do the following: Plot3D[Flatten[Table[{{i, j, k}, {i, j, k}}, {i, 5, 10}, {j, 5, 10}, {k, 5, 10}], 1], {i, 1, 5}, {j, 1, 5}, {k, 1, 5}] Or if you want to

use List instead of Table: ListPlot3D[Flatten[{{i, j, k}, {i, j, k}}, {i, 5, 10}, {j, 5, 10}, {k, 5, 10}], PlotPoints -> 4] A new type of prosthetic blood vessel, based on human blood vessels, is being developed at the University of Wisconsin and Research Foundation Institute for Scientific Discovery (University of Wisconsin's stem cell research institute) in partnership with Emedco LLC, a firm that develops micro-tissue manufacturing technologies. Currently, scientists are unable to create fully functional blood vessels that can be used in heart or other tissue transplants as they are not capable of forming

actual blood vessels. The technology being developed utilizes human blood vessels and human induced pluripotent stem cells (iPS cells) derived from the patient's own cells. The iPS cells are then cultured in complex 3-D conditions in bioreactors, creating a special environment that allows the iPS cells to assemble themselves into a fully functional blood vessel. The blood vessel will then be "cloned" or replicated in laboratory conditions and implanted into the patient to regenerate the area of tissue that has

Ask HN: How does your mobile web design stack up against your mobile app? - techiferous

I'm thinking of focusing on mobile web design and development for my start-up. If you're a high traffic mobile app, what do you feel is the best approach for generating traffic? Are there any advantages to developing a mobile app or is it better to just get started with building a mobile website?

====== psirunner Most of our traffic comes from directly to the mobile website from our mobile apps. We also have a mobile app where users can log in and update their privacy preferences with one tap. On top of this, we aggregate the

data from the mobile apps for analytics and other purposes. Even though we developed the mobile app first, developing a mobile website is important because we needed to integrate authentication and sign in with a third party API. For our team, it's always better to develop native apps that do something that your mobile website can't. ------ yeukhon How is the website different from a native app? ~~~ techiferous Sure, there are some differences: -Mobile website designs are centered around the web experience. -A mobile web app is typically tailored to one function. -I think some of the advantages of having an app

are: 1) certain mobile functionalities not available through a website 2) interaction with media (i.e. photos, videos, mp3s) 3) faster load time On the other hand, I think the disadvantages of having an app are: 1) you usually have to create a mobile website first before you can fully create an app. ------ linker3000 In my humble opinion, if the site (mobile web or otherwise) gives a crappy experience to _everyone_, then it's probably not worth investing in. How clobenpropit protects against oxaliplatin-induced oxidative stress. Oxaliplatin is a platinum-based chemotherapy agent used to treat metastatic and locally

advanced colorectal cancer. Although the efficacy of oxaliplatin has been shown to be improved by combining with various agents, a cumulative dose-dependent adverse effect, such as neurotoxicity, is one drawback. Although a neuroprotective effect of clobenpropit,
